

Teton builds one of the thickest, most durable floor/frame systems in the industry. An 8" I-beam substructure, 2"x4" floor joists, plus 3/4" tongue and groove plywood flooring provide over 12" of thickness. Not only is this the strongest floor/frame system available, it is the best insulated.

The strength and durability of the framing is highlighted by the structural support system of Teton's slide-out rooms.

The slide-out room will never sag or leak because of the high-strength steel mechanism. The ram tubes provide the push-pull operation of the room while the 2-1/2" square structural steel tubes make it stable. The mechanism will provide years of maintenance-free service.
